Quasi-static modeling associated with earthquakes

- Strain accumulation associated with interseismic deformation
  - What is the stressing rate on faults X and Y?
  - Where is strain accumulating in the crust?
- Coseismic stress changes and fault slip
  - What was the slip distribution in earthquake A?
  - How did earthquake A change the stresses on faults X and Y?
- Postseismic relaxation of the crust
  - What rheology is consistent with observed postseismic deformation?
  - Can aseismic creep or afterslip explain the deformation?
Dynamic modeling associated with earthquakes

- Modeling of strong ground motions
  - Forecasting the amplitude and spatial variation in ground motion for scenario earthquakes
- Coseismic stress changes and fault slip
  - How did earthquake A change the stresses on faults X and Y?
- Earthquake rupture behavior
  - What fault constitutive models/parameters are consistent with the observed rupture propagation in earthquake A?
Crustal Deformation Modeling

Elasticity problems where geometry does not change significantly

Volcanic deformation associated with magma chambers and/or dikes

- Inflation
  - What is the geometry of the magma chamber?
  - What is the potential for an eruption?
- Eruption
  - Where is the deformation occurring?
  - What is the ongoing potential for an eruption?
- Dike intrusions
  - What is the geometry of the intrusion?
  - What is the pressure change and/or amount of opening/dilatation?
Crustal Deformation Modeling

Developers

- Brad Aagaard (USGS, lead developer)
- Charles Williams (GNS Science, formerly at RPI)
- Matthew Knepley (Rice Univ., formerly Univ. of Chicago)

Combined dynamic modeling capabilities of EqSim (Aagaard) with the quasi-static modeling capabilities of Tecton (Williams)

Use modern software engineering (modular design, testing, documentation, distribution) to develop an open-source, community code
Governing Equations

Elasticity equation

\[ \sigma_{ij,j} + f_i = \rho \ddot{u} \text{ in } V, \]  
(1)

\[ \sigma_{ij} n_j = T_i \text{ on } S_T, \]  
(2)

\[ u_i = u_i^0 \text{ on } S_u, \text{ and } \]  
(3)

\[ R_{ki}(u_i^+ - u_i^-) = d_k \text{ on } S_f. \]  
(4)

Multiply by weighting function and integrate over the volume,

\[ - \int_V (\sigma_{ij,j} + f_i - \rho \ddot{u}_i) \phi_i \, dV = 0 \]  
(5)

After some algebra,

\[ - \int_V \sigma_{ij} \phi_{i,j} \, dV + \int_{S_T} T_i \phi_i \, dS + \int_V f_i \phi_i \, dV - \int_V \rho \ddot{u}_i \phi_i \, dV = 0 \]  
(6)
Discretize Domain Using Finite Elements

PyLith v2.0.0 and later uses interpolated meshes

Interpolated triangular mesh

Vertices

Cells

Interpolated quadrilateral mesh

Vertices

Edges

Cells

Optimized triangular mesh

Vertices

Cells

Optimized quadrilateral mesh

Vertices

Cells
Using numerical quadrature we convert the integrals to sums over the cells and quadrature points

\[ - \sum_{\text{vol cells quad pts}} \sum_{\text{quad pts}} \sigma_{ij} N^j_i w_q |J_{\text{cell}}| + \sum_{\text{surf cells quad pts}} \sum_{\text{quad pts}} T_i N^i_n w_q |J_{\text{cell}}| \\
+ \sum_{\text{vol cells quad pts}} \sum_{\text{quad pts}} f_i N^n_i w_q |J_{\text{cell}}| \\
- \sum_{\text{vol cells quad pts}} \sum_{\text{quad pts}} \rho \sum_m \ddot{a}_i^m N^m N^n w_q |J_{\text{cell}}| = \vec{0} \quad (7) \]
Form system of algebraic equations

\[ A(t) \ddot{u}(t) = \vec{b}(t) \] (8)

where

\[ A_{ij}^{nm}(t) = \sum_{\text{vol cells quad pts}} \sum \frac{1}{4} C_{ijkl}(t)(N_{j}^{m} + N_{k}^{m})(N_{j}^{n} + N_{i}^{n})w_{q}|J_{\text{cell}}| \] (9)

\[ b_{i}(t) = \sum_{\text{surf cells quad pts}} \sum T_{i}(t)N^{n}w_{q}|J_{\text{cell}}| + \sum_{\text{vol cells quad pts}} \sum f_{i}(t)N^{n}w_{q}|J_{\text{cell}}| \] (10)

and solve for \( \ddot{u}(t) \).
Fault Interface

Fault tractions couple deformation across interface

PyLith

Fault Implementation
Implementation: Fault Interfaces

Use cohesive cells to control fault behavior

(a) Original mesh
(b) Add colocated vertices
(c) Update cells with fault faces
(d) Classify cells and update remaining cells

PyLith Fault Implementation
Fault Implementation: Governing Equations
Terms in governing equation associated with fault

- Tractions on fault surface are analogous to boundary tractions
  \[ \ldots + \int_{S_T} \vec{\phi} \cdot \vec{T} \, dS - \int_{S_{f+}} \vec{\phi} \cdot \vec{t} \, dS + \int_{S_{f-}} \vec{\phi} \cdot \vec{t} \, dS \ldots = 0 \]
  
  Neumann BC          Fault +         Fault -

- Constraint equation relates slip to relative displacement
  \[ \int_{S_f} \vec{\phi} \cdot (\vec{d} - \vec{u}_+ + \vec{u}_-) \, dS = 0 \]
  
  Slip                   Relative Disp.
Fault Slip Implementation

Use Lagrange multipliers to specify slip

- System without cohesive cells
  - Conventional finite-element elasticity formulation
    \[ A\vec{u} = \vec{b} \]
  - Fault slip associated with relative displacements across fault
    \[ C\vec{u} = \vec{d} \]

- System with Lagrange multiplier constraints for fault slip
  \[
  \begin{pmatrix}
  A & C^T \\
  C & 0 \\
  \end{pmatrix}
  \begin{pmatrix}
  \vec{u} \\
  \vec{l} \\
  \end{pmatrix}
  =
  \begin{pmatrix}
  \vec{b} \\
  \vec{d} \\
  \end{pmatrix}
  \]

- Prescribed (kinematic) slip
  Specify fault slip (\(\vec{d}\)) and solve for Lagrange multipliers (\(\vec{l}\))

- Spontaneous (dynamic) slip
  Adjust fault slip to be compatible with fault constitutive model
Advantages

- Fault implementation is local to cohesive cell
- Solution includes tractions generating slip (Lagrange multipliers)
- Retains block structure of matrix, including symmetry
- Offsets in mesh mimic slip on natural faults

Disadvantages

- Cohesive cells require adjusting topology of finite-element mesh
- Scalable preconditioner/solver is more complex
Workflow for Running PyLith

Running PyLith
Spatial Databases
User-specified field/value in space

- **Examples**
  - Uniform value for Dirichlet (0-D)
  - Piecewise linear variation in tractions for Neumann BC (1-D)
  - SCEC CVM-H seismic velocity model (3-D)

- Generally independent of discretization for problem

- **Available spatial databases**
  - **UniformDB** Optimized for uniform value
  - **SimpleDB** Simple ASCII files (0-D, 1-D, 2-D, or 3-D)
  - **SCECCVMH** SCEC CVM-H seismic velocity model v5.3
  - **ZeroDispDB** Special case of UniformDB
Features in PyLith v2.1
Bugfix release for v2.0 plus some minor new features

- **Time integration schemes and elasticity formulations**
  - Implicit for quasistatic problems (neglect inertial terms)
    - Infinitesimal strains
    - Small strains
  - Explicit for dynamic problems
    - Infinitesimal strains
    - Small strains
    - Numerical damping via viscosity

- **Bulk constitutive models (2-D and 3-D)**
  - Elastic model
  - Linear Maxwell viscoelastic models
  - Generalized Maxwell viscoelastic models
  - Power-law viscoelastic model
  - Drucker-Prager elastoplastic model
Features in PyLith v2.1 (cont.)

- **Boundary and interface conditions**
  - Time-dependent Dirichlet boundary conditions
  - Time-dependent Neumann (traction) boundary conditions
  - Absorbing boundary conditions
  - Kinematic (prescribed slip) fault interfaces w/multiple ruptures
  - Dynamic (friction) fault interfaces
  - Fault interfaces with T intersections
  - Time-dependent point forces
  - Gravitational body forces

- **Fault constitutive models**
  - Static friction
  - Linear slip-weakening
  - Linear time-weakening
  - Dieterich-Ruina rate and state friction w/ageing law
Features in PyLith v2.1 (cont.)

- Automatic and user-controlled time stepping
- Ability to specify initial stress/strain state
- Importing meshes
  - LaGriT: GMV/Pset
  - CUBIT: Exodus II
  - ASCII: PyLith mesh ASCII format (intended for toy problems only)
- Output: VTK and HDF5 files
  - Solution over volume
  - Solution over surface boundary
  - Solution interpolated to user-specified points w/station names
  - State variables (e.g., stress and strain) for each material
  - Fault information (e.g., slip and tractions)
Features in PyLith v2.1 (cont.)

- Automatic conversion of units for all parameters
- Parallel uniform global refinement
- PETSc linear and nonlinear solvers
  - Custom preconditioner with algebraic multigrid solver
- Output of simulation progress estimates runtime
PyLith Development
See PyLith User Resources for detailed development plan

- Immediate priorities [in progress]
  - New fault implementation for spontaneous rupture
    *Much faster convergence for quasi-static simulations*
  - Support higher order basis functions
    *Provides much higher resolution for a given mesh*
  - Adaptive time stepping
  - Prepare for multi-physics
  - Scaling to 1000 cores

- Short-term priorities
  - Multiphysics: Elasticity + Fluid flow + Heat flow
  - Multigrid nonlinear solver

- Multi-cycle earthquake modeling
  *Resolve interseismic, coseismic, and postseismic deformation*
  - Coupling solvers for quasistatic and dynamic deformation
PyLith Development
Planned Releases

- v2.1.1 (Sep 2015)
  - Bugfixes
    - Restarting simulations for viscoelastic materials
    - Finite strain
  - Better examples for gravitational body forces, initial conditions, and finite strain

- v3.0 (Late 2015)
  - New fault implementation for spontaneous rupture
  - Support for higher order basis functions
  - Adaptive time stepping

- v3.1 (Summer 2016)
  - Support for incompressible elasticity
  - Heat and fluid flow coupled to elastic deformation
Design Philosophy
Modular, extensible, and smart

- Code should be flexible and modular
- Users should be able to add new features without modifying code, for example:
  - Boundary conditions
  - Bulk constitutive models
  - Fault constitutive models
- Input/output should be user-friendly
- Top-level code written in Python (expressive, dynamic typing)
- Low-level code written in C++ (modular, fast)
PyLith Design: Focus on Geodynamics

Leverage packages developed by computational scientists

- PETSc
- spatialdata
- FIAT
- NetCDF
- HDF5
- Proj.4
- Pyre
- numpy
- BLAS/LAPACK
- MPI

PyLith Architecture
PyLith Application Flow

**PyLithApp**

main()
  - mesh.create()
  - problem.initialize()
  - problem.run()

**TimeDependent (Problem)**

initialize()
  - formulation.initialize()

run()
  - while (t < tEnd)
    - dt = formulation.dt()
    - formulation.prestep(dt)
    - formulation.step(dt)
    - formulation.poststep(dt)

**Implicit (Formulation)**

initialize()

prestep()
  - set values of constraints

step()
  - compute residual
  - solve for disp. incr.

poststep()
  - update disp. field
  - write output
PyLith as a Hierarchy of Components

Unit and Regression Testing
Automatically run more than 1800 tests on multiple platforms whenever code is checked into the source repository.

- Create tests for nearly every function in code during development
  - Remove most bugs during initial implementation
  - Isolate and expose bugs at origin
- Create new tests to expose reported bugs
  - Prevent bugs from reoccurring
- Rerun tests whenever code is changed
  - Code continually improves (permits optimization with quality control)
- Binary packages generated automatically upon successful completion of tests
- Additional full-scale parallel regression tests are run before releases
Mesh Generation Tips
There is no silver bullet in finite-element mesh generation

- **Hex/Quad versus Tet/Tri**
  - Hex/Quad are slightly more accurate and faster
  - Tet/Tri easily handle complex geometry
  - Easy to vary discretization size with Tet, Tri, and Quad cells
  - There is no easy answer
    - For a given accuracy, a finer resolution Tet mesh that varies the discretization size in a more optimal way *might* run faster than a Hex mesh

- **Check and double-check your mesh**
  - Were there any errors when running the mesher?
  - Are the boundaries, etc marked correctly for your BC?
  - Check mesh quality (aspect ratio should be close to 1)
CUBIT Workflow

1. Create geometry
   - 1. Construct surfaces from points, curves, etc or basic shapes
   - 2. Create domain and subdivide to create any interior surfaces
     - Fault surfaces must be interior surfaces (or a subset) that completely divide domain
     - Need separate volumes for different constitutive models, not parameters

2. Create finite-element mesh
   - 1. Specify meshing scheme
   - 2. Specify mesh sizing information
   - 3. Generate mesh
   - 4. Smooth to fix any poor quality cells

3. Create nodesets and blocks
   - 1. Create block for each constitutive model
   - 2. Create nodeset for each BC and fault
   - 3. Create nodeset for buried fault edges
   - 4. Create nodeset for ground surface for output (optional)

4. Export mesh in Exodus II format (.exo files)
CUBIT/Trelis Issues

Keep in mind the scales of the observations you are modeling

- **Topography/bathymetry**
  - Ignore topography/bathymetry unless you know it matters
  - For rectilinear grid, create UV net surface
  - Convert triangular facets to UV net surface via mapped mesh

- **Fault surfaces**
  - Building surfaces from contours is usually easiest
  - Include features at the resolution that matters

- **Performance**
  - Number of points in spline curves/surfaces has huge affect on mesh generation runtime
  - CUBIT/Trelis do not run in parallel
  - Use uniform global refinement in PyLith for large sims (>10M cells)
CUBIT/Trelis Best Practices

Issue: Changes in geometry cause changes in object ids
Soln: Name objects and use APREPRO or Python to eliminate hardwired ids wherever possible

Issue: Splines with many points slows down operations
Soln: Reduce the number of points per spline

Issue: Surfaces meet in small angles creating distorted cells
Soln: Trim geometry to eliminate features smaller than cell size

Issue: Difficulty meshing complex geometry with Hex cells
Soln: Use Tet cells even if it requires a finer mesh

Issue: Hex mesh over-samples parts of the domain
Soln: Use Tet mesh and vary discretization within domain

Issue: Extended surfaces create very complex geometry
Soln: Subdivide geometry before webcutting to eliminate overly complex geometry
General Numerical Modeling Tips

Start simple and progressively add complexity and increase resolution

- **Start in 2-D, if possible, and then go to 3-D**
  - Much smaller problems ⇒ much faster turnaround
  - Start with an exact solver
  - Experiment with meshing, boundary conditions, solvers, etc.
  - Keep in mind how physics differs from 3-D

- **Start with coarse resolution and then increase resolution**
  - Much smaller problems ⇒ much faster turnaround
  - Start with an exact solver
  - Experiment with meshing, boundary conditions, solvers, etc.
  - Increase resolution until solution resolves features of interest
    - Resolution will depend on spatial scales in BC, initial conditions, deformation, and geologic structure
    - Is geometry of domain important? At what resolution?
    - Displacement field is integral of strains/stresses
    - Resolving stresses/strains requires fine resolution simulations

- Use your intuition and analogous solutions to check your results!
PyLith Tips

- Read the PyLith User Manual
- Do not ignore error messages and warnings!
- Use an example/benchmark as a starting point
- Quasi-static simulations
  - Start with a static simulation and then add time dependence
  - Check that the solution converges at every time step
- Dynamic simulations
  - Start with a static simulation
  - Shortest wavelength seismic waves control cell size
- CIG Short-Term Crustal Dynamics mailing list
cig-short@geodynamics.org
- PyLith User Resources
  http://wiki.geodynamics.org/software:pylith:start
PyLith Debugging Tools

- pylithinfo [--verbose] [PyLith args]
  Dumps all parameters with their current values to text file

- Command line arguments
  - --help
  - --help-components
  - --help-properties
  - --petsc.start_in_debugger (run in xterm)
  - --nodes=N (to run on N processors on local machine)

- Journal info flags turn on writing progress
  [pylithapp.journal.info]
  timedependent = 1
  - Turns on/off info for each type of component independently
  - Examples turn on writing lots of info to stdout using journal flags
Getting Started

- Read the PyLith User Manual
- Work through the examples
  - Chapter 7 of the PyLith manual
  - Input files are provided with the PyLith binary
    src/pylith-2.1.0/examples
  - Input files are provided with the PyLith source tarball
    src/examples
- Modify an example to look like a problem of interest
